Computer System Design Department, Benghazi University

April 16, 2020

Prerequisite

The code was executed on ubuntu 18.04.4 LTS with python version 3.6.9.

You can find the code of each exercise here.

Exercise 1

This is a link to the full Exercise. In this Exercise, you will learn how to:

- Run a python program.

- Print results.

- Difference between double quotation mark (") and single quotation mark (').

- Use comments.

How to run a python program

First, you write a program and store it in a file with .py extension. To Execute the file, you run the following command in the terminal:

```
$ python3 filename.py
```

Printing Outputs and using Comments

Using print function, you can print any string as output. You can also comment any line using hash # and what comes after # will be ignored.

```python
print("This is Not funny");print("Yay! Printing");

# print("I'd much rather you 'not'.")

print('I "said" do not touch this')
```
